## Introduction

This document is a very brief introduction to the PulpoAudio DPinga salsa percussion Plugins.

It covers only the description of the instruments parameters and a description of the sound/midi key mapping.

In case of trouble, questions or if you have some other requests, please contact me at [pulpo@pulponet.de](mailto:pulpo@pulponet.de)

## Parameters

### Global Parameters

#### *VSens*

Velocity Sensitivity ranges from 0 (no sensitivity at all) to 1.0 (full sensitivity) and then further to 2.0 (extended, exponential sensitivity)

#### *TuneSt*

Detune the entire instrument by this amount of semitones (-24 to +24)

#### *TuneCt*

Fine detune the entire instrument by this amount of semitones (-0.5 to +0.5)

#### *Vol*

Raise or lower the instrument volume by this amount of dB (-infinite to +24dB)

### Legato Control

All sounds behind a "stroke" (see also stroke control) will sound monophonic. This means, if you hit the same drum head twice, the first hit will be cut when it is hit the second time. This will respond to the following legato settings:

#### *Release*

Amount of seconds (0 to 20) that we give the prior hit to fade out (if its set to 0 then the cut may sound a bit violent).

#### *Offset*

Amount of seconds (0 to 20) that the new stroke will skip from the beginning (we could skip the attack portion, e.g.).

#### *Attack*

Amount of seconds (0 to 20) that we give the new sound to fade in (we could soften the attack this way).

### Stroke Control

All of the strokes (take this as a synonym for drum or drum head) will sound monophonic. A drum head in real life can produce only one sound at a time, so the instrument is remodeled after this principle (only DPinga Timbales Cymbal sounds multitimbral).

Each stroke can be configured with a volume, pan and tuning.

#### *Vol*

Raise or lower the stroke volume by this amount of dB (-infinite to +24dB)

#### *Pan*

Move the stroke in panorama as the value indicates.

#### *TuneSt*

Detune the stroke by this amount of semitones (-24 to +24)

### *TuneCt*

Fine detune the stroke by this amount of semitones (-0.5 to +0.5)

### *Envelope*

A global envelope control gives us the possibility to modify the envelope of all strokes.

### *Attack*

Amount of seconds (0 to 20) that we give a sound to fade in (we could soften the attack this way).

### *Hold*

Amount of seconds (0 to 20) that we hold the level at 0.0dB after attack.

### *Decay*

Amount of seconds (0 to 20) that the decay (to sustain level) will take.

### *Sustain*

Level in dB that the sustain portion will be played at

### *Release*

Amount of seconds (0 to 20) that we give the sound to fade out when the key is released (this is only given for DPinga Timbal – Cymbal. All other sounds don't respond to a release time as it makes no sense)

## DPinga V0.9 Salsa Percussion Plugins – Programs

The programs of the DPinta Salsa Percussion Plugins are as follows:

DPinga Timbal:

- 1: Timbal light (reduced sound set for easy playability)
- 2: Timbal (full sound set)

DPinga Congas:

- 1: Congas light (reduced sound set for easy playability)
- 2: Congas (full sound set)

DPinga Bongo:

- 1: Bongo (full sound set)

Find the sound distribution on the midi keyboard for all three plugins on the next pages.
